

02_UI_UX_FIGMA_STITCH_HANDOFF

Visual and interaction handoff for the connected Stitch/Figma design.

Purpose

This document tells Antigravity how to use the connected Stitch/Figma design. The visual design is the source of truth for layout, typography, spacing, components and interaction states. Do not replace it with a generic admin dashboard.

Required screens

Overview: live camera, system status, active alerts, events today, device health and recent events.

Live Monitor: large camera, detection overlays, restricted polygon, sensor panel, current decision and diagnostics.

Events: searchable/filterable event list with severity, type, time, camera, zone and status.

Event Details: snapshot, video/clip, timeline, confidence, track ID, zone, sensor evidence and acknowledge/resolve/false-positive actions.

Zones: polygon editor with create/edit/delete/enable/disable and normalized coordinates.

Sensors: radar, ground, rain/environment and buzzer state with REAL/SIMULATED/OFFLINE badges.

Devices: ESP32 and future Raspberry Pi health and heartbeat.

Camera Health: FPS, latency, brightness, blur/visibility, resolution, last frame and health status.

Analytics: event counts, detections, false positives, sensor confirmations, average confidence and uptime.

Settings: YOLO thresholds, temporal parameters, cooldown, fusion weights, camera, ESP32, sensors and runtime mode.

Visual behaviour

Use clear severity hierarchy. Critical alerts must be visually unmistakable. Simulation and experimental features must have explicit badges. Keep animations subtle and never block the video pipeline.

Show live camera diagnostics such as FPS, inference latency, queue depth and dropped frames.

Provide clear empty, loading, offline, error and success states.

Zone interaction

Operator selects Configure Zone, clicks vertices over the camera, finishes the polygon, names it, saves it and enables it. Vertices can be moved or deleted. Save normalized 0–1 coordinates.

Evidence interaction

Click an event to open its snapshot/video. Show whether media is local, uploading, stored, failed or available in Supabase Storage.
